

Net Force Particle Model: Elevator Lab

The elevator in the main building at John Burroughs School is not raised and lowered with cables. Instead, it rides on a giant piston that extends four stories into the ground. In today's activity you will look at how the forces change on you as you ride in the elevator.

Prep: Read the following questions **before** going over to the elevator, and note the observations you need to make:

1. At what times in the motion of the elevator does the bathroom scale show your weight (or the weight of the person standing on the scale)?

Make a mental note of the scale reading.

2. At what times in the motion does the scale show a value **greater than** your weight?

Make a mental note of the scale reading.

3. At what times in the motion does the scale show a value **less than** your weight?

Make a mental note of the scale reading.

Experiment: Take the bathroom scales with you and take a ride in the elevator. Have someone stand on the bathroom scale that doesn't mind revealing his or her weight to others. Observe and remember the forces for numbers 1, 2 and 3 above.

Data/Observations: When you return to the classroom record your observations.

	Force in pounds	Force in Newtons (1 pound = 4.5 Newtons)
Scale reading at rest:	_____	_____
Maximum scale reading:	_____	_____
Minimum scale reading:	_____	_____

Label the following as **equal** to, **greater** than, or **less** than the scale reading at rest.

- _____ At rest at the bottom
- _____ Starting to go up
- _____ Going up at constant speed
- _____ Slowing to stop at the top
- _____ Stopped at the top
- _____ Starting to go down
- _____ Going down at constant speed.
- _____ Slowing to stop at the bottom.

Calculate the mass of the person on the scale in kilograms: _____

Force Analysis: Draw a quantitative force diagram for the passenger in each of the following situations during the elevator ride. Label the forces in Newtons. To the right of each diagram draw a **velocity** and **acceleration** vector that describes the motion of person in the elevator. Calculate the net force and the acceleration of the person.

<p>1. At rest at the bottom <u>Quantitative force diagram</u></p> <p>velocity vector:</p> <p>acceleration vector:</p> <p>net force =</p> <p>acceleration =</p>	<p>2. Starting to go up <u>Quantitative force diagram</u></p> <p>velocity vector:</p> <p>acceleration vector:</p> <p>net force =</p> <p>acceleration =</p>
<p>3. Going up at constant speed <u>Quantitative force diagram</u></p> <p>velocity vector:</p> <p>acceleration vector:</p> <p>net force =</p> <p>acceleration =</p>	<p>4. Slowing to stop at the top <u>Quantitative force diagram</u></p> <p>velocity vector:</p> <p>acceleration vector:</p> <p>net force =</p> <p>acceleration =</p>

<p>5. Stopped at the top <u>Quantitative force diagram</u></p> <p>velocity vector:</p> <p>acceleration vector:</p> <p>net force =</p> <p>acceleration =</p>	<p>6. Starting to go down <u>Quantitative force diagram</u></p> <p>velocity vector:</p> <p>acceleration vector:</p> <p>net force =</p> <p>acceleration =</p>
<p>7. Going down at constant speed. <u>Quantitative force diagram</u></p> <p>velocity vector:</p> <p>acceleration vector:</p> <p>net force =</p> <p>acceleration =</p>	<p>8. Slowing to stop at the bottom. <u>Quantitative force diagram</u></p> <p>velocity vector:</p> <p>acceleration vector:</p> <p>net force =</p> <p>acceleration =</p>

9. How do the upward accelerations compare to the downward accelerations? Explain why.
